3.1 The best packages. ....	7
3.2 Stenograpy with Emacs .....	8

# 1. Haskell

---

**The hard cliff.**

# 1.1 Haskell + AtCoder

It was a genius idea to get started with Haskell and AtCoder at the same time. Initially it went well pretty well, just like I assumed. It turned out, however, I couldn't do with neither of them after six months of practice. I was highly depressed, and started serious battles..

## **2. Nix**

---

**The best world.**

## 2.1 Pure, isolated environment

Nix used to be so hard that it made me a copy-paste programmer of `shell.nix`. It got better when NixOS & Flakes book came out. I started configuring NixOS with `flake.nix`, wrote some packages and even contributed to `nixpkgs`. Not only it's reproducible, it's also nice that we can bundle many features of a package on installation, e.g., all of the tree-sitter grammars.

## 3. Emacs

---

**The best text editor  
multiplexer.**

## 3.1 The best packages.

Emacs has tons of killer features. One of them is centaur-tabs; it shows buffers, but in groups. If you open another project's file, the buffer bar switches to the project's buffers. You'll hit many of these goodies if you use Emacs.

## 3.2 Stenography with Emacs

Today I'm interested in stenography. I wonder if it works well with coding and Emacs. Let's try out and see how it works (or not works)!
